Robot Faces Project Rubric

Key Concept	Extensive Evidence	Convincing Evidence	Limited Evidence	No Evidence
Program Development - Program Sequence	They *sequenced the program well*[1] and all shapes on the screen appear as intended.	Program may contain a few incorrectly sequenced code resulting in a few shapes hidden behind others unintentionally.	Program has significant sequencing errors, resulting in many shapes unintentionally hidden or overlapping others.	Errors in program sequencing are significant enough to keep the output from resembling intended drawing.
Position - Shapes	They used at least four *different types of shapes*[2] and placed them using the coordinate system[3].	They use at least three different types of shapes and place them using the coordinate system.	They use at least one type of shape and place it using the coordinate system.	They use no shapes in the program.
Variables / Storing Information	The program creates and correctly uses at least four variables. All variables have descriptive names and use the randomNumber block to give the program a different look each time the program is run.	They created at least three variables and used them correctly in the program. All variables have descriptive names. At least two of the variables use the randomNumber block to give the program a different look each time the program is run.	They created at least one variable and used it in the program. You used randomness in the program at least once.	No variables or randomNumbers are used in the program.
Creating a Digital Artifact	They used elements as described in the project guide and clearly displayed a robot face.	Elements are generally used as described in the project guide.	They used some elements as described in the project guide.	They did not fill out the project guide, or it is unrelated to the program.

1. Sequenced the program well

- If the program code is not sequenced correctly, some elements, such as shapes, may be unintentionally hidden behind other shapes.

2. Different types of shapes:

- Each shape listed below would be considered a “different type” of shape. Students should use at least 4 different types of shapes.
    - rect(x, y, width, height)
    - ellipse(x, y, width, height)
    - line(x1, y1, x2, y2)
    - arc(x, y, width, height, start, stop)
    - point(x, y)
    - regularPolygon(x, y, sides, size)
    - shape(x1, y1, x2, y2, … xN, yN)

3. Using the coordinate system:

- Coordinates of shapes should ***not*** be the default values unless the default is required to create their robot face.
